Title : The Treatment of Hypertension with Redergam and the Alkaloids of the Rauvolfia serpentina (R.S.) group.

Orig Pub : Terapevt. arkhiv, 1957, 29, No 7, 53-63.

Abstract : The treatment of hypertensive patients with Redergam did not result in a persistent decrease in blood pressure. Under the influence of reserpine, reduction in blood pressure occurred during the 1st-3rd week following onset of treatment. Optimal dosage of reserpine should not be over 1 mg per day. Reduction in arterial blood pressure was unstable. An improvement in the patients' sense of well-being paralleled reduction in arterial blood pressure. -- From author's resume.

TITLE: A New Series of 6 and 10 kV Power Transformers of the
First and Second Frame Sizes

PERIODICAL: Vestnik elektropromyshlennosti, 1959, № 9, pp 5-8 (USSR)

ABSTRACT: A new series of general-purpose transformers designated type TSM has been developed. Altogether there are ten different ratings, each being greater than the previous one by a factor of 1.73. The ratings in the first frame size are 20, 35, 60 and 100 kVA and in the second frame size 180, 320 and 560 kVA. In addition, subsidiary ratings of 135, 240 and 420 kVA are made in the second frame size. The high-voltage windings will be for 6 or 10 kV, though 6.3 kV will be supplied for existing installations. Off-load tapping switches of $\pm 5\%$ are provided on the high-voltage side. The ratio of copper to iron loss is 3.5 - 4.0. To reduce deterioration of transformer oil and insulation the maximum temperature rise at the top of the oil has been reduced from 60°C to 55°C, and that of the windings reduced from 70°C in the old standard to 65°C. The insulation, and the clearances in the main insulation, are the same for both 6 and 10 kV

transformers. Further reduction in these clearances is undesirable because it would impair cooling. The cores will be made of annealed cold-rolled steel grade E330, 0.35 mm thick. The sheets will be insulated with varnish. A number of changes have been made, mainly with the object of reducing weight and size or to facilitate manufacture. A transformer type TSM 100/6-10 is illustrated in Fig 1, alongside an old TM series transformer of the same rating. A transformer type TSM 180/6-10 is illustrated in Fig 2. The three-limb core-type construction is used; the core clamps are made of angle iron and the clamping arrangements are described. An illustration of a typical core and coil assembly for the new series of transformers is given in Fig 5. The core and coils no longer have any attachment to the lid and are fully supported by the tank, so that there is less risk of damage in transport. The high-voltage leads are made of flexible wire and the low-voltage leads of copper strip. The new transformer tanks for 20 and 35 kVA are made of 2 mm sheet steel stiffened by cooling ribs. From 60 kVA and upwards

tube-cooled tanks are used, the tubes being oval and not round. The tanks themselves are of so-called "oval" section. Even the smallest of the 6 kV transformers have conservators. The other fittings are described. The total losses of the new transformers are 15-25% lower than those of transformers conforming to the existing standard GOST 401-41, also of transformers made by the East German firms TRO and TUR. Fig. 3 compares the weights of oil in the old and new series transformers and in the German transformers. If all Soviet transformers in these ratings were made in the new type the total annual economy of copper would be 120 tons, of steel 900 tons, of transformer oil 4000 tons and of other materials, including insulation, 3900 tons. Tests on the new transformers have confirmed that the design and construction are well chosen.

There are 5 figures.
